

IDS Lift-Net Tech Support

Use Re-install on a new PC

Note: "jobname" will be files and folders within the "lift_net" folder that correspond to the building or complex name or address.

There is a reinstall file that will need to be copied to get the correct physical port assignments, passwords, user options, and layout. (This is located in the *jobname*\reinstall folder.

Click on "System", "this Computer Setup".

On the "Replay\Setup\restart" tab, click on "Use this computer to retrieve Reinstall Files when a connection is made to any computer on the network", This action will transfer the reinstall files to secondary computers so if one fails, we can use this file to replace this computer.

The procedure will be:

1. Run the V16 install setup.
2. Transfer the ???_Rst.zip file (described above) to the Lift_net folder on the new computer. (Where ??? is the Lift-Net network ID for the computer that we are replacing). Unzip it, and then unzip the *jobname*.zip file.
3. Transfer a liftnet2.zip and otherln.zip from a good computer (or from a backup media) to the new computer and unzip it.
